Advanced Tutorial on Implementing PFPGrowthPlus Algorithm

In this tutorial, we explain how the Periodic Frequent Puttern Growth Plus (PFPGrowthPlus) algorithm can be implemented by varying the minimum support values

Step 1: Import the PFPGrowthPlus algorithm and pandas data frame

```
In [1]: from PAMI.periodicFrequentPattern.basic import PFPGrowthPlus as alg import pandas as pd
```

Step 2: Specify the following input parameters

```
inputFile = 'temporal_T10I4D100K.csv'
seperator='\foralle{t}'
maxmunPeriodCount=5000
minimumSupportCountList = [100, 150, 200, 250, 300]
#minimumSupport can also specified between 0 to 1. E.g., minSupList = [0.005, 0.006,
result = pd. DataFrame(columns=['algorithm', 'minSup', 'maxPer', 'patterns', 'runtime'
#initialize a data frame to store the results of PFPGrowthPlus algorithm
```

Step 3: Execute the PFPGrowthPlus algorithm using a for loop

```
algorithm = 'PFPGrowthPlus'
                                     #specify the algorithm name
In [3]:
        for minSupCount in minimumSupportCountList:
            obj = alg. PFPGrowthPlus('temporal_T10I4D100K.csv', minSup=minSupCount, maxPer=max)
            obj. startMine()
            #store the results in the data frame
            result.loc[result.shape[0]] = [algorithm, minSupCount, maxmunPeriodCount, len(obj
        periodic-frequent patterns were generated successfully using PFPGrowth++ algorithm
        print(result)
In [4]:
               algorithm minSup maxPer
                                          patterns
                                                      runtime
                                                                  memory
        0 PFPGrowthPlus
                             100
                                    5000
                                             25462 12.942107
                                                               579301376
        1 PFPGrowthPlus
                             150
                                    5000

                                                               577437696
        2 PFPGrowthPlus
                             200
                                    5000
                                             13251 11.130969
                                                               574922752
        3 PFPGrowthPlus
                             250
                                    5000
                                              7702 10.318596
                                                               570114048
        4 PFPGrowthPlus
                             300
                                    5000
                                              4552 10. 184319
                                                               566091776
```

Step 5: Visualizing the results

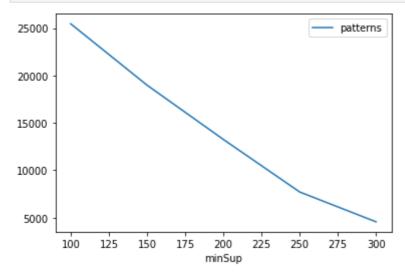

Step 5.1 Importing the plot library

```
In [5]: from PAMI.extras.graph import plotLineGraphsFromDataFrame as plt
```

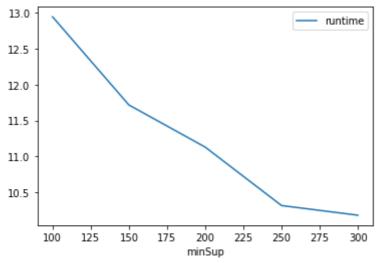

2022/08/22 11:13 PFPGrowthPlus-ad

Step 5.2. Plotting the number of patterns

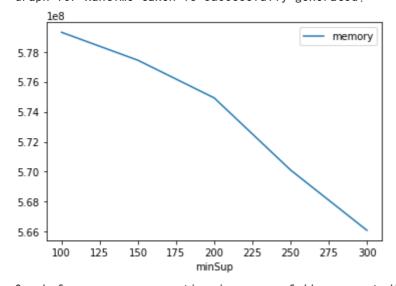

In [6]: ab = plt.plotGraphsFromDataFrame(result)
ab.plotGraphsFromDataFrame() #drawPlots()

Graph for No Of Patterns is successfully generated!

Graph for Runtime taken is successfully generated!

Graph for memory consumption is successfully generated!

Step 6: Saving the results as latex files

In [7]: from PAMI.extras.graph import generateLatexFileFromDataFrame as gdf gdf.generateLatexCode(result)

Latex files generated successfully
